

LECTURE 12

RECURSION

MCS 275 Spring 2022

David Dumas

LECTURE 12: RECURSION

Course bulletins:

- Homework 4 due Tuesday at Noon CST
- Anonymous feedback survey coming this week
- Project 1 grading underway, ETA Thursday

RECURSION

In computer science, **recursion** refers to a method of solving a problem that depends on solving smaller versions of the same problem.

Usually, recursion involves a function calling itself.

STRATEGIES USING RECURSION

- **Divide and conquer:** A problem can be split into pieces; solutions for the pieces can be combined to the full solution.
 - e.g. Mergesort
- **Decrease and conquer:** Reduce a problem for a given input (e.g. n) to the answer for a slightly smaller input (e.g. $n-1$) and a bit of extra work.
 - e.g. Factorial

ITERATION

Recursive solutions are often contrasted with iterative solutions.

- **Iterative:** Loops and local variables keep track of all state (work to be done, work completed, next ...)
- **Recursive:** Arguments keep track of current state; call stack stores work in progress; return values send back results.

Recursive solutions can always be converted to iterative ones, often at the cost of more complex code.

STOP CONDITION

A function that always calls itself will never finish!

Recursion must include some kind of stop condition—a case in which the function can directly return an answer instead of calling itself.

TODAY'S EXAMPLES

- Factorial
- Fibonacci numbers
- Paper folding sequence

FACTORIAL

The classic first example of recursion, computing

$$n! = n \times (n - 1) \times \cdots \times 2 \times 1.$$

The argument to the function decreases with each subsequent call, so it eventually reaches the stop condition ($n \leq 1$).

FIBONACCI

The Fibonacci numbers are defined by

$$F_0 = 0, F_1 = 1, \text{ and } F_n = F_{n-1} + F_{n-2}$$

So the sequence begins 0, 1, 1, 2, 3, 5, 8, 13, ...

The definition immediately suggests a recursive implementation.

PAPER FOLDING SEQUENCE

PAPER FOLDING SEQUENCE

PAPER FOLDING SEQUENCE

Let's use \oplus to mean concatenation of binary sequences, so $0110 \oplus 11 = 011011$.

If A is a binary sequence, let \bar{A} denote the sequence with 0 and 1 switched, e.g. $\overline{11101} = 00010$

Finally, let A^r denote the sequence in opposite order, e.g. $10010^r = 01001$.

$$PFS(n) = PFS(n-1) \oplus 1 \oplus \overline{PFS(n-1)^r}$$

REFERENCES

- Lutz discusses recursive functions in Chapter 19 (pages 555-559 in the print edition).
- [Intro to Python for Computer Science and Data Science](#) by Deitel and Deitel discusses recursion in Chapter 11. The online version of this text is freely available to UIC students, faculty, and staff. (You will first need to [log in](#) with you UIC email.)
- The open textbook [Think Python, 2ed, by Allen B. Downey](#) discusses recursion in [Sections 5.8 to 5.10](#).
- Computer Science: An Overview by Brookshear and Brylow discusses recursion in Section 5.5. (This book is often an optional text for MCS 260.)
